Threat Intelligence: Smart Security for Your Network

Introducing ClearSignal AI — the system that cuts through the noise and finds real cyber threats before it's too late.

The Problem: Alert Fatigue

10,000+

Security alerts every single day — too many for any human to read

Mostly False Alarms

Like a bird triggering a motion sensor — harmless, but the alarm still goes off

Real Attacks Get Missed

Analysts are exhausted and distracted — dangerous threats slip right through

⚠ This is called "**Alert Fatigue**" — and it's one of the biggest problems in cybersecurity today.

What is a Cyber Attack?

A hacker tries to **break into a company's computer network** — to steal data, shut down systems, or cause serious damage.

- Attacks happen constantly, around the clock
- Most are blocked automatically by basic defenses
- The real danger: we can't easily tell a **fake alarm** from a **real attack**

Why Current Systems Fail

Every suspicious activity triggers an alert — even completely harmless ones. Here's what analysts actually see:

 Employee logs in
from a new location

Flagged as suspicious →
Alert sent

 Routine system
backup runs overnight

Flagged as suspicious →
Alert sent

 Real hacker
stealing passwords

Flagged as suspicious →
Alert sent

All three look identical. Analysts can't tell which one is actually dangerous.

Our Solution: ClearSignal AI

Filters False Alarms

Automatically ignores the noise so analysts don't have to

Identifies Real Threats

Shows only the 3–5 alerts that actually matter

Writes the Report

Delivers a clear summary straight to the security commander

How ClearSignal Works: Step 1 — Filter

What gets filtered out?

- Employee logging in at a normal time
- Routine nightly backups
- Standard software updates

What moves forward?

Anything that doesn't match normal, everyday behavior gets flagged and passed to Step 2 for a closer look.

How ClearSignal Works: Step 2 — Analyze

Act Like a Detective

ClearSignal looks at suspicious alerts and asks: "Have I seen this before?"

Check the Database

It compares the alert against a library of known hacker methods and attack patterns

Name the Attacker

Example: 500 failed logins = "Brute Force Attack" → likely from hacker group **Red Dragon**

How ClearSignal Works:

Step 3 — Report

Once a real threat is confirmed, ClearSignal writes a **simple, clear summary** — no technical jargon, just the facts.

🚨 **ALERT:** Brute Force Attack detected on Server A.
Hacker group: **Red Dragon**.
Status: **Blocked**.

- The report goes directly to the security commander
- The boss sees exactly what happened and what to do next
- No guesswork. No delay. Immediate action.

The Impact: Before vs. After ClearSignal

✗ Before ClearSignal

- Analysts face **10,000 alerts** every day
- Real attacks get lost in the noise
- Response time: **hours**
- Damage already done before anyone notices

✓ After ClearSignal

- Analysts see only **3–5 real alerts**
- Every real attack is caught
- Response time: **minutes**
- Attacks stopped before any damage is done

10,000

Alerts Before

Overwhelming — impossible to manage manually

5

Alerts After

Only what truly matters reaches the analyst

~90%

Faster Response

From hours of delay to minutes of action

Why This Matters

Cyber attacks are not just a tech problem — they affect real people and real money.

Millions Lost Every Year

Companies lose enormous amounts of money to cyber attacks that could have been stopped

Your Data at Risk

A single breach can expose the personal information of thousands of customers

ClearSignal Changes the Game

Security teams can finally focus on what actually matters — stopping real threats before they cause harm

THANK YOU
